The polypeptide is useful in preparing a composition for treating or preventing proliferative disease e.g. cancer. The present sequence represents human telomerase reverse transcriptase DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preparing a composition e.g., cancer.

```
CC detecting expression of markers (MR1) e.g. Zic family member 3 (ZIC3), as given in specification, other than human telomerase reverse transcriptase CC (hTBRT) or octamer binding transcription factor (Oct)3/4, or a marker CC (MR2) such as cripto or podocalyxin-like protein and hTBRT and/or Oct3/4 (CC or second marker chosen from (MR2). Also included are maintaining (M2) pPS cells in a pluripotent state (involves causing them to express one of the following markers (MR3) at a higher level, FOXO1A, ZIC3, hypothetical (CC pare zinc finger protein SZF1-1 or zinc finger protein of cerebellum (CC ZIC2, or any other marker (MR4) chosen from PHD protein Jade-1), CRAB-Zinc finger protein (ZNF300), etc., as given in the specification), causing them to express one of the markers chosen from CC (MR3) or (MR4) (or markers chosen from EATA binding protein in the specification), maintaining pPS cells to differentiate into a particular (CC promoter element binding protein (COPBB), etc., as given in the collection that is encoded by a gene that down-regulated upon CC (MR3) or (MR4) (or markers chosen from GATA binding protein in the specification), causing pPS cells in a pluripotent state (involves culturing pPS cells or their progeny in the presence of a normally CC secreted protein that is encoded by a gene that down-regulated upon CC (inferentiation of human embryonic stem (hBS) cells, chosen from CC (inferentiation of hES cells, chosen from PSI protein gene, Tax (CC gene, etc., as given in the presence of a normally CC gene, etc., as given in the specification), causing sequence to be preferentially expressed in undifferentiated pps cells, causing an encoding sequence to be preferentially expressed in undifferentiated pps cells, causing an encoding sequence consoling (MS) differentiated cells from less differentiated cells from any consoling cells expressing a surface marker chosen from any cone of MR1 from cells not expressing the marker), causing pPS cells to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Assessing culture of undifferentiated primate pluripotent stem cells by detecting expression of markers e.g., Zic family member 3, other than human telomerase reverse transcriptase/octamer binding transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (STAN/)

The method (M1) is useful for assessing culture of undifferentiated primate pluripotent stem cells and for assessing the growth characteristics of a cell population. The cell population has been obtained by culturing cells from human blastocyst or from a human patient suspected of having a clinical condition related to abnormal cell growth. The method further involves determining whether the cell population is pluripotent from the marker expression and assessing whether the patient has a malignancy from the marker expression. The present sequence is a cDNA whose expression is down regulated in pluripotent stem cells.

                                                                                                                    á
                                                                                                                                                                                                                                            This sequence encodes a novel human catalytic telomerase sub-unit (hTC).

The encoded protein can be used in screening assays to identify modulators of telomerase and to treat or inhibit cellular disorders, death, defects and/or other pathological processes involving telomerase, particularly cancer and ageing (also suitable for this are agents that stimulate, inhibit or mimic the activity of the subunit). Antisense modeleic acids inhibit telomerase action (by binding to specific mRNA), mucleic acids inhibit telomerase action (by binding to specific mRNA), particularly in neoplastic cells and may be expressed in vivo. Antibodies and fragments of the protein, used as probes or primers, are used to diagnose telomerase-related conditions (especially neoplasia) by (i) detecting abnormal levels of the subunit protein in body fluids or tissues or (ii) by measuring the amount of the encoding nucleic acid. Expression of the nucleic acid encoding the subunit mRNA is confined to tumour cells, in contrast to the ubiquitous expression of the telomerase
                                                                                                                                                    Query Match

Novel hTERT-immortalized cell line (human telomerase reverse transcriptase) useful for human vaccine production and prepa antigen, such as a virus or virus-derived agent. preparation Ģ,

```
The present sequence is that of hTERT cDNA in plasmid pGRN121. hTERT is C the catalytic subunit of human telomerase. Claimed immortalised cell lines for use in vaccine production are adapted to express hTERT.

C liles for use in vaccine production are adapted to express hTERT.

C Sultable cell lines comprise human diploid fibroblasts, e.g. MRC-5 or W138 cells, transfected with hTERT cDNA or infected by a retrovirus carrying hTERT cDNA, and are capable of supporting antigen production. A method for preparing such cell lines using recombinant techniques is provided. The cell lines are also used as a diagnostic test for the presence of a virus, such as human cytomegalovirus, and to determine the efficacy of antiviral agents by testing the capability of a modified virus containing a reporter gene to infect the cells. The cell lines have the ability, which can be impaired in cell lines immortalised by other methods, of being able to support viral replication. The cells remain comphologically suitable for viral/vaccine cultivation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

This is the catalytic protein component of telomerase and is also referred to as hEST2. This correlates with cell proliferative capacity, cell immortality, and the development of a neoplastic phenotype. Human TRT antisense oligonucleotides are useful for diagnostic or prognostic applications to telomerase related conditions, including cancer. They are expression and activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human telomerase reverse transcriptase; hTRT; telomerase; hEST2; catalytic protein component; cell proliferative capacity; cell immortality; neoplastic phenotype; diagnostic application; prognostic application; telomerase related condition; cancer; therapeutic agent; telomerase expression; telomerase activity; ds

                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                        Score

Publication No. US20040106128A1

GENERAL INFORMATION:
APPLICANT: Geron Corporation
APPLICANT: Majumdar, Anish Sen
APPLICANT: Majumdar, Anish Sen
APPLICANT: Forlkis, Maria
APPLICANT: Forlkis, Maria
APPLICANT: Forlkis, Maria
APPLICANT: Wang, Zhuo
IITLE OF INVENTION: Cancer Vaccines Containing Xenogeneic Epitopes of Telomerase Revei
FILE OF INVENTION ITANScriptase
FILE REFERENCE: 086/002
CURRENT APPLICATION NUMBER: US/10/602,441
CURRENT FILING DATE: 2003-06-24
PRIOR APPLICATION NUMBER: 60/393,295
PRIOR APPLICATION NUMBER: 60/393,295
PRIOR TILING DATE: 2002-06-27
INUMBER OF SEQ ID NOS: 12
SOFTWARE: PatentIn version 3.1
SEQ ID NO 1
                                                                                                            ; LENGTH: 4015
